# **Gross Salary**

Ramesh's basic salary is input through the keyboard. His dearness allowance is 40% of his basic salary, and his house rent allowance is 20% of his basic salary. Write a program to calculate his gross salary.

Sample Input:

10000

Sample Output:

16000

For example:

Input	Result
10000	16000

#### PROGRAM:

s=int(input())

da = s\*0.4

ha=s\*0.2

print(int(s+da+ha))

	Input	Expected	Got	
~	10000	16000	16000	~
~	20000	32000	32000	~
~	28000	44800	44800	~

# Gain percent

Alfred buys an old scooter for Rs. X and spends Rs. Y on its repairs. If he sells the scooter for Rs. Z (Z>X+Y). Write a program to help Alfred to find his gain percent. Get all the above-mentioned values through the keyboard and find the gain percent.

#### Input Format:

The first line contains the Rs X

The second line contains Rs Y

The third line contains Rs Z

Sample Input:

10000

250

15000

Sample Output:

46.34 is the gain percent.

#### For example:

Input	Result
45500 500 60000	30.43 is the gain percent.

#### PROGRAM:

buys=int(input())

repair=int(input())

sells=int(input())

g=(((sells-(buys+repair))/(buys+repair))\*100)

print("{:.2f}".format(g), "is the gain percent.")

~	10000 250 15000	46.34 is the gain percent.	46.34 is the gain percent.	~	
~	45500 500 60000	30.43 is the gain percent.	30.43 is the gain percent.	~	
•	5000 0 7000	40.00 is the gain percent.	40.00 is the gain percent.	~

# **Deposits**

In many jurisdictions, a small deposit is added to drink containers to encourage people to recycle them. In one particular jurisdiction, drink containers holding one liter or less have a \$0.10 deposit and drink containers holding more than one liter have a \$0.25 deposit. Write a program that reads the number of containers of each size(less and more) from the user. Your program should continue by computing and displaying the refund that will be received for returning those containers. Format the output so that it includes a dollar sign and always displays exactly two decimal places.

Sample Input

10

20

Sample Output

Your total refund will be \$6.00.

## For example:

Input	Result
20 20	Your total refund will be \$7.00.

#### PROGRAM:

a=int(input())

b=int(input())

c=a\*0.1

d=b\*0.25

e=c+d

print("Your total refund will be \${:.2f}.".format(e))

	Input	Expected	Got	
/	20 20	Your total refund will be \$7.00.	Your total refund will be	\$7.00.
/	11 22	Your total refund will be \$6.60.	Your total refund will be	\$6.60.
~	123 200	Your total refund will be \$62.30.	Your total refund will be	\$62.30.
~	76 38	Your total refund will be \$17.10.	Your total refund will be	\$17.10.

# **Carpenter**

Justin is a carpenter who works on an hourly basis. He works in a company where he is paid Rs 50 for an hour on weekdays and Rs 80 for an hour on weekends. He works 10 hrs more on weekdays than weekends. If the salary paid for him is given, write a program to find the number of hours he has worked on weekdays and weekends.

#### Hint:

If the final result(hrs) are in -ve convert that to +ve using abs() function The abs() function returns the absolute value of the given number.

```
number = -20
absolute_number = abs(number)
```

print(absolute\_number)
# Output:20

## **Sample Input:**

450

### **Sample Output:**

weekdays 10.38 weekend 0.38

#### For example:

Input	Result
450	weekdays 10.38 weekend 0.38

#### PROGRAM:

```
s=int(input())
a=(500-s)/130
print("weekdays {:.2f}".format(abs(a)+10))
print("weekend {:.2f}".format(abs(a)))
```

weekend 0.38 weekend 0.38  500 weekdays 10.00 weekdays 10.00 ✓ weekend 0.00 weekdays 83.08 weekend 73.08 weekend 73.08	weekend 0.38 weekend 0.38  500 weekdays 10.00 weekdays 10.00 weekend 0.00 weekend 0.00  10000 weekdays 83.08 weekdays 83.08

# **Doll Sings**

In London, every year during Dasara there will be a very grand doll show. People try to invent new dolls of different varieties. The best-sold doll's creator will be awarded with a cash prize. So people broke their heads to create dolls innovatively. Knowing this competition, Mr.Lokpaul tried to create a doll that sings only when an even number is pressed and the number should not be zero and greater than 100.

IF Lokpaul wins print true, otherwise false.

```
Sample Input
```

10

Sample Output

True

Explanation:

Since 10 is an even number and a number between 0 and 100, True is printed

#### PROGRAM:

```
a=int(input())
if(a>0 and a<100 and a%2==0):
    print("True")
else:
    print("False")</pre>
```

# **Compound Interest**

Pretend that you have just opened a new savings account that earns 4 percent interest per year. The interest that you earn is paid at the end of the year, and is added to the balance of the savings account. Write a program that begins by reading the amount of money deposited into the account from the user. Then your program should compute and display the amount in the savings account after 1, 2, and 3 years. Display each amount so that it is rounded to 2 decimal places.

Sample Input:

10000

Sample Output:

Balance as of end of Year 1: \$10400.00.

Balance as of end of Year 2: \$10816.00.

Balance as of end of Year 3: \$11248.64

# Eligible to donate blood

A team from the Rotract club had planned to conduct a rally to create awareness among the Coimbatore people to donate blood. They conducted the rally successfully. Many of the Coimbatore people realized it and came forward to donate their blood to nearby blood banks. The eligibility criteria for donating blood are people should be above or equal to 18 and his/ her weight should be above 40. There was a huge crowd and staff in the blood bank found it difficult to manage the crowd. So they decided to keep a system and ask the people to enter their age and weight in the system. If a person is eligible he/she will be allowed inside.

Write a program and feed it to the system to find whether a person is eligible or not.

#### Input Format:

Input consists of two integers that correspond to the age and weight of a person respectively.

Output Format:

Display True(IF ELIGIBLE)

Display False (if not eligible)

Sample Input

19

45

Sample Output

True

```
PROGRAM:

a=int(input())

b=int(input())

if(a>=18 and b>40):

print("True")

else:

print("False")
```

# Tax and Tip

The program that you create for this exercise will begin by reading the cost of a meal ordered at a restaurant from the user. Then your program will compute the tax and tip for the meal. Use your local tax rate (5 percent) when computing the amount of tax owing. Compute the tip as 18 percent of the meal amount (without the tax). The output from your program should include the tax amount, the tip amount, and the grand total for the meal including both the tax and the tip. Format the output so that all of the values are displayed using two decimal places.

Sample Input

100

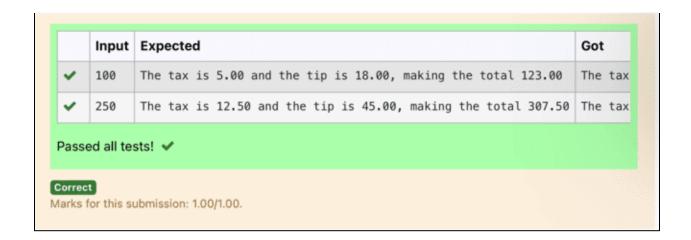

Sample Output

The tax is 5.00 and the tip is 18.00, making the total 123.00

#### PROGRAM:

a=int(input())

print("The tax is  $\{:.2f\}$  and the tip is  $\{:.2f\}$ , making the total  $\{:.2f\}$ ".format((a\*0.05),(a\*0.18),(a+((a\*0.05)+(a\*0.18)))))

# **Classifying Triangles**

A triangle can be classified based on the lengths of its sides as equilateral, isosceles or scalene. All three sides of an equilateral triangle have the same length. An isosceles triangle has two sides that are the same length, and a third side that is a different length. If all of the sides have different lengths then the triangle is scalene.

Write a program that reads the lengths of the three sides of a triangle from the user. Then display a message that states the triangle's type.

Sample Input 1

60

60

60

Sample Output 1

### For example:

Input	Result
40 40 80	That's a isosceles triangle

### PROGRAM:

```
a=int(input())
b=int(input())
c=int(input())
if(a==b and b==c):
    print("That's a equilateral triangle")
elif(a!=b and b==c or a==b and b!=c):
    print("That's a isosceles triangle")
elif(a!=b and b!=c):
    print("That's a scalene triangle")
```

	Input	Expected	Got	
~	60 60 60	That's a equilateral triangle	That's a equilateral triangle	~
~	40 40 80	That's a isosceles triangle	That's a isosceles triangle	~
~	50 60 70	That's a scalene triangle	That's a scalene triangle	~
~	50 50 80	That's a isosceles triangle	That's a isosceles triangle	*
~	10 10 10	That's a equilateral triangle	That's a equilateral triangle	~

# **Electricity Bill**

Write a program to calculate and print the Electricity bill where the unit consumed by the user is given from test case. It prints the total amount the customer has to pay. The charge are as follows:

Unit Charge / Unit
Upto 199 @1.20
200 and above but less than 400 @1.50
400 and above but less than 600 @1.80
600 and above @2.00

If bill exceeds Rs.400 then a surcharge of 15% will be charged and the minimum bill should be of Rs.100/-

Sample Test Cases

Test Case 1
Input
50
Output
100.00
Test Case 2
Input
300
Output

### For example:

517.50

Input	Result
500	1035.00

### PROGRAM:

a=float(input())

b=0

if(a<=199):

b=a\*1.2

elif(200<=a<400):

b=a\*1.5

elif(400<=a<600):

b=a\*1.8

elif(a>600):

b=a\*2.0

```
if (int(b)<100):
    print("{:.2f}".format(100))
else:
    if(b>400.00):
        print("{:.2f}".format((b+(b*0.15))))
    else:
        print("{:.2f}".format(b))
```

### IN/OUT

Ms. Sita, the faculty handling programming lab for you is very strict. Your seniors have told you that she will not allow you to enter the week's lab if you have not completed atleast half the number of problems given last week. Many of you didn't understand this statement and so they requested the good programmers from your batch to write a program to find whether a student will be allowed into a week's lab given the number of problems given last week and the number of problems solved by the student in that week.

### Input Format:

Input consists of 2 integers.

The first integer corresponds to the number of problems given and the second integer corresponds to the number of problems solved.

**Output Format:** 

Output consists of the string "IN" or "OUT".

Sample Input and Output:

Input

8

3

Output

OUT

#### For example:

Input	Result
8 3	OUT

```
PROGRAM:

a=int(input())

b=int(input())

c=(a/2)

if(c>b):

print("OUT")

else:

print("IN")
```

Ex. No. : 3.5 Date:

## **Vowel or Consonant**

In this exercise you will create a program that reads a letter of the alphabet from the user. If the user enters a, e, i, o or u then your program should display a message indicating that the entered letter is a vowel. If the user enters 'y' then your program should display a message indicating that sometimes y is a vowel, and sometimes y is a consonant. Otherwise your program should display a message indicating that the letter is a consonant.

Sample Input 1

i

Sample Output 1

```
It's a vowel.

Sample Input 2

y

Sample Output 2

Sometimes it's a vowel... Sometimes it's a consonant.

Sample Input3

c

Sample Output 3

It's a consonant.
```

### For example:

Input	Result
у	Sometimes it's a vowel Sometimes it's a consonant.
u	It's a vowel.
p	It's a consonant.

## **PROGRAM:**

```
a=input()
if(a=='a' or a=='e' or a=='i' or a=='o' or a=='u'):
    print("It's a vowel.")
elif(a=='y'):
    print("Sometimes it's a vowel... Sometimes it's a consonant.")
else:
    print("It's a consonant.")
```

	Input	Expected	Got
~	i	It's a vowel.	It's a vowel.
~	у	Sometimes it's a vowel Sometimes it's a consonant.	Sometimes it's a
~	С	It's a consonant.	It's a consonant
~	e	It's a vowel.	It's a vowel.
/	r	It's a consonant.	It's a consonant

# Leap Year

Most years have 365 days. However, the time required for the Earth to orbit the Sun is actually slightly more than that. As a result, an extra day, February 29, is included in some years to correct for this difference. Such years are referred to as leap years. The rules for determining whether or not a year is a leap year follow:

- Any year that is divisible by 400 is a leap year.
- Of the remaining years, any year that is divisible by 100 is not a leap year.
- Of the remaining years, any year that is divisible by 4 is a leap year.
- All other years are not leap years.

Write a program that reads a year from the user and displays a message indicating whether or not it is a leap year.

```
Sample Input 1
1900
Sample Output 1
1900 is not a leap year.
Sample Input 2
2000
Sample Output 2
2000 is a leap year.

PROGRAM:

year=int(input())

if(year%400==0):

print(year,"is a leap year.")

else:

print(year,"is not a leap year.")
```

		Expected	Got		
	1900	1900 is not a leap year.	1900 is not a leap year.	~	
/	2000	2000 is a leap year.	2000 is a leap year.	~	
~	2100	2100 is not a leap year.	2100 is not a leap year.	~	
_	2400	2400 is a leap year.	2400 is a leap year.	~

# Month name to days

The length of a month varies from 28 to 31 days. In this exercise you will create a program that reads the name of a month from the user as a string. Then your program should display the number of days in that month. Display "28 or 29 days" for February so that leap years are addressed.

Sample Input 1

**February** 

Sample Output 1

February has 28 or 29 days in it.

Sample Input 2

March

Sample Output 2

March has 31 days in it.

Sample Input 3

April

Sample Output 3

April has 30 days in it.

#### For example:

Input	Result
February	February has 28 or 29 days in it.

Input	Result
March	March has 31 days in it.

```
PROGRAM:
m=input()
if(m=="January"):
  print(m,"has 31 days in it.")
elif(m=="February"):
  print(m,"has 28 or 29 days in it.")
elif(m=="March"):
  print(m,"has 31 days in it.")
elif(m=="April"):
  print(m,"has 30 days in it.")
elif(m=="May"):
  print(m,"has 31 days in it.")
elif(m=="June"):
  print(m,"has 30 days in it.")
elif(m=="July"):
  print(m,"has 31 days in it.")
elif(m=="August"):
  print(m,"has 31 days in it.")
elif(m=="September"):
  print(m,"has 30 days in it.")
```

```
elif(m=="October"):
    print(m,"has 31 days in it.")
elif(m=="November"):
    print(m,"has 30 days in it.")
elif(m=="December"):
    print(m,"has 31 days in it.")
```

	Input	Expected	Got
<b>/</b>	February	February has 28 or 29 days in it.	February has 28 or 29 days in it.
<b>/</b>	March	March has 31 days in it.	March has 31 days in it.
~	April	April has 30 days in it.	April has 30 days in it.
~	May	May has 31 days in it.	May has 31 days in it.

# Pythagorean triple

Three numbers form a Pythagorean triple if the sum of squares of two numbers is equal to the square of the third.

For example, 3, 5 and 4 form a Pythagorean triple, since 3\*3 + 4\*4 = 25 = 5\*5 You are given three integers, a, b, and c. They need not be given in increasing order. If they form a Pythagorean triple, then print "Yes", otherwise, print "No".

### Sample Input

3

5

4

#### Sample Output

Yes

#### For example:

Input	Result
3 4 5	Yes

#### PROGRAM:

a=int(input())

b=int(input())

c=int(input())

if(a\*a+b\*b==c\*c):

print("yes")

```
elif(a*a+c*c==b*b):
    print("yes")
elif(c*c+b*b==a*a):
    print("yes")
else:
    print("no")
```

# Second last digit

Write a program that returns the second last digit of the given number. Second last digit is being referred 10the digit in the tens place in the given number.

For example, if the given number is 197, the second last digit is 9.

Note1 - The second last digit should be returned as a positive number. i.e. if the given number is -197, the second last digit is 9.

Note 2 - If the given number is a single digit number, then the second last digit does not exist. In such cases, the program should return -1. i.e. if the given number is 5, the second last digit should be returned as -1.

### For example:

Input	Result
197	9

### PROGRAM:

```
a=int(input())
b=str(abs(a))
l=len(b)
if(l>1):
   print(int(b[-2]))
else:
   print(-1)
```

	Input	Expected	Got	
/	197	9	9	~
/	-197	9	9	~
/	5	-1	-1	~
/	123456	5	5	~
,	8	-1	-1	~

### **Chinese Zodiac**

The Chinese zodiac assigns animals to years in a 12 year cycle. One 12 year cycle is shown in the table below. The pattern repeats from there, with 2012 being another year of the dragon, and 1999 being another year of the hare.

Year Animal

2000 Dragon

2001 Snake

2002 Horse

2003 Sheep

2004 Monkey

2005 Rooster

2006 Dog

2007 Pig

2008 Rat

2009 Ox

2010 Tiger

2011 Hare

Write a program that reads a year from the user and displays the animal associated with that year. Your program should work correctly for any year greater than or equal to zero, not just the ones listed in the table.

Sample Input 1

2010

Sample Output 1

2010 is the year of the Tiger.

Sample Input 2

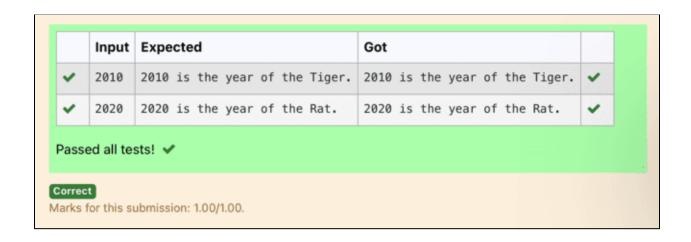

2020

Sample Output 2

2020 is the year of the Rat.

```
PROGRAM;
a=int(input())
b=a%100
c=b\%12
if(c==0):
  print(a,"is the year of the Dragon.")
elif(c==1):
  print(a,"is the year of the Snake.")
elif(c==2):
  print(a,"is the year of the Horse.")
elif(c==3):
  print(a,"is the year of the Sheep.")
elif(c==4):
  print(a,"is the year of the Monkey.")
elif(c==5):
  print(a,"is the year of the Rooster.")
elif(c==6):
  print(a,"is the year of the Dog.")
elif(c==7):
  print(a,"is the year of the Pig.")
elif(c==8):
  print(a,"is the year of the Rat.")
```

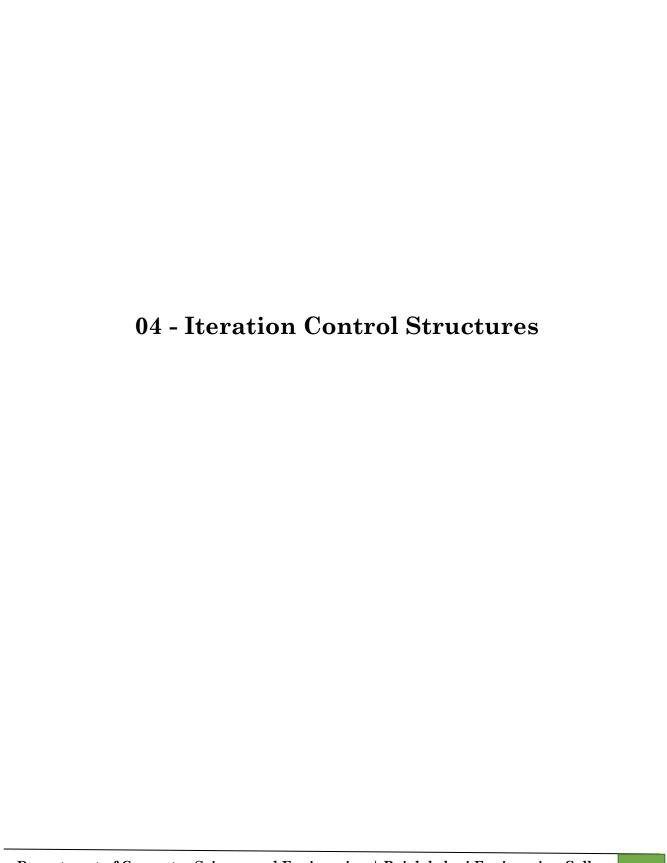

```
elif(c==9):
    print(a,"is the year of the Ox.")
elif(c==10):
    print(a,"is the year of the Tiger.")
elif(c==11):
    print(a,"is the year of the Hare.")
```

### Non Repeated Digit Count

Write a program to find the count of non-repeated digits in a given number N. The number will be passed to the program as an input of type int.

Assumption: The input number will be a positive integer number  $\geq 1$  and  $\leq 25000$ . Some examples are as below.

If the given number is 292, the program should return 1 because there is only 1 non-repeated digit '9' in this number

If the given number is 1015, the program should return 2 because there are 2 non-repeated digits in this number, '0', and '5'.

If the given number is 108, the program should return 3 because there are 3 non-repeated digits in this number, '1', '0', and '8'.

If the given number is 22, the function should return 0 because there are NO non-repeated digits in this number.

#### For example:

Input	Resul t
292	1
1015	2
108	3
22	0

#### PROGRAM:

```
n=int(input())
l=[]
k=[]
while n>0:
a=n%10
n=n//10
l.append(a)
```

for i in range(len(l)):
 if l.count(l[i])==1:
 k.append(l[i])
print(len(k))

,	292	1	1	~
•	1015	2	2	~
•	108	3	3	~
,	22	0	0	~

## **Prime Checking**

Write a program that finds whether the given number N is Prime or not. If the number is prime, the program should return 2 else it must return 1.

Assumption:  $2 \le N \le 5000$ , where N is the given number.

Example 1: if the given number N is 7, the method must return 2

Example 2: if the given number N is 10, the method must return 1

#### For example:

Input	Result
7	2
10	1

```
PROGRAM;
```

```
a=int(input())
for i in range(2,a):
    if(a%2==0):
        flag=0
    elif(a%i!=0):
        flag=1
    else:
        flag=0
if(flag==1):
    print("2")
elif(flag==0):
    print("1")
```

Ex. No. 4.4 Date: Register No.: Name: Next Perfect Square Given a number N, find the next perfect square greater than N. Input Format: Integer input from stdin. Output Format: Perfect square greater than N. Example Input: 10 Output: 16 PROGRAM: a=int(input()) c=[]for i in range(0,a): b=i\*\*2 if(b>a): c.append(b) print(c[0])

### Nth Fibonacci

Write a program to return the nth number in the fibonacci series. The value of N will be passed to the program as input.

NOTE: Fibonacci series looks like -

0, 1, 1, 2, 3, 5, 8, 13, 21, 34, 55, . . . and so on.

i.e. Fibonacci series starts with 0 and 1, and continues generating the next number as the sum of the previous two numbers.

- first Fibonacci number is 0,
- second Fibonacci number is 1,
- third Fibonacci number is 1,
- fourth Fibonacci number is 2,
- fifth Fibonacci number is 3,
- sixth Fibonacci number is 5,
- · seventh Fibonacci number is 8, and so on.

#### For example:

Input:

7

Output

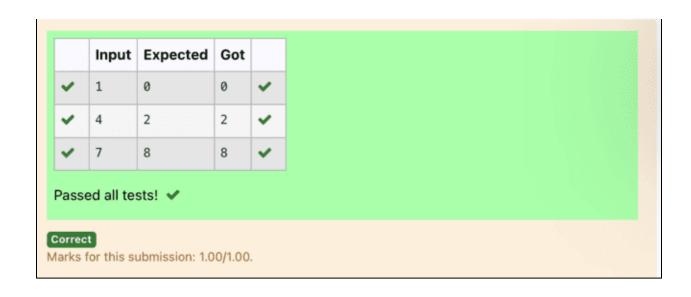

8

#### PROGRAM:

$$a=[0,1]$$

for i in range(0,100):

a.append(a[-1]+a[-2])

## **Disarium Number**

A Number is said to be Disarium number when the sum of its digit raised to the power of their respective positions becomes equal to the number itself. Write a program to print number is Disarium or not.

Input Format:

Single Integer Input from stdin.

Output Format:

Yes or No.

Example Input:

175

Output:

Yes

Explanation

 $1^1 + 7^2 + 5^3 = 175$ 

Example Input:

123

Output:

No

For example:

**InputResult** 

175 Yes

123 No

import math

```
PROGRAM:

n=int(input())

a=len(str(n))

sum=0

x=n

while(x!=0):

r=x%10

sum=int(sum+math.pow(r,a))

a-=1

x=x//10

if(sum==n):

print("Yes")

else:

print("No")
```

## **Sum of Series**

Write a program to find the sum of the series  $1 + 11 + 111 + 1111 + \dots + n$  terms (n will be given as input from the user and sum will be the output)

Sample Test Cases

Test Case 1

Input

4

Output

1234

Explanation:

as input is 4, have to take 4 terms.

1 + 11 + 111 + 1111

Test Case 2

Input

6

Output

123456

#### For example:

Input	Result
3	123

```
PROGRAM:

n=int(input())

b=1

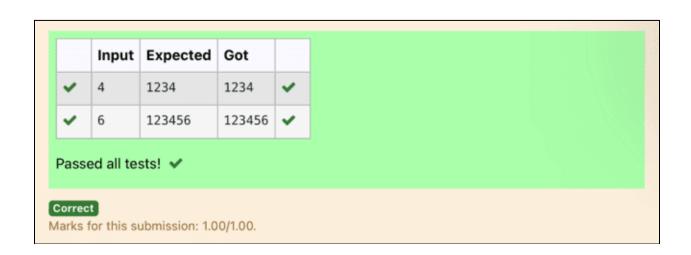

sum=0

for i in range(1,n+1):

sum+=b

b=(b*10)+1

print(sum)
```

### **Balanced Array**

Given an array of numbers, find the index of the smallest array element (the pivot), for which the sums of all elements to the left and to the right are equal. The array may not be reordered.

```
Example
arr=[1,2,3,4,6]
      the sum of the first three elements, 1+2+3=6. The value of the last element is 6.
      Using zero based indexing, arr[3]=4 is the pivot between the two subarrays.
      The index of the pivot is 3.
Constraints
      3 \le n \le 10^5
      1 \le arr[i] \le 2 \times 10^4, where 0 \le i < n
      It is guaranteed that a solution always exists.
The first line contains an integer n, the size of the array arr.
Each of the next n lines contains an integer, arr[i], where 0 \le i < n.
Sample Case 0
Sample Input 0
4
1
2
3
Sample Output 0
Explanation 0
The sum of the first two elements, 1+2=3. The value of the last element is 3
Using zero based indexing, arr[2]=3 is the pivot between the two subarrays
The index of the pivot is 2
Sample Case 1
Sample Input 1
3
1
2
Sample Output 1
Explanation 1
The first and last elements are equal to 1
```

Using zero based indexing, arr[1]=2 is the pivot between the two subarrays

The index of the pivot is 1.

For example:

10101	ampic.
Input	Result
4 1 2 3 3	2
3 1 2 1	1

#### PROGRAM:

```
a=int(input())
l=[]
for i in range(a):
    c=int(input())

## **Distinct Elements in an Array**

Program to print all the distinct elements in an array. Distinct elements are nothing but the unique (non-duplicate) elements present in the given array.

Input Format:

First line take an Integer input from stdin which is array length n.

Second line take n Integers which is inputs of array.

Output Format:

Print the Distinct Elements in Array in single line which is space Separated

Example Input:

```
1
      2
      2
      3
      3
      123
PROGRAM:
def merge_arrays_without_duplicates(arr1, arr2):
  result\_set = set(arr1 + arr2)
  merged_sorted_array = sorted(result_set)
  return merged_sorted_array
def process_input():
  n1 = int(input())
  array1 = []
  for \_ in range(n1):
    element = int(input())
    array1.append(element)
  n2 = int(input())
  array2 = []
  for \_ in range(n2):
    element = int(input())
    array2.append(element)
  result = merge_arrays_without_duplicates(array1, array2)
```

### Find the Factor

Determine the factors of a number (i.e., all positive integer values that evenly divide into a number) and then return the  $p^{th}$  element of the <u>list</u>, sorted ascending. If there is no  $p^{th}$  element, return 0.

#### **Constraints**

 $1 \le n \le 10^{15}$  $1 \le p \le 10^9$ 

The first line contains an integer n, the number to factor.

The second line contains an integer p, the 1-based index of the factor to return.

```
Sample Case 0
Sample Input 0
10
3
Sample Output 0
Explanation 0
Factoring n = 10 results in \{1, 2, 5, 10\}. Return the p = 3^{rd} factor, 5, as the
answer.
Sample Case 1
Sample Input 1
10
5
Sample Output 1
Explanation 1
Factoring n = 10 results in \{1, 2, 5, 10\}. There are only 4 factors and p = 5,
therefore 0 is returned as the answer.
Sample Case 2
Sample Input 2
Sample Output 2
Explanation 2
Factoring n = 1 results in \{1\}. The p = 1st factor of 1 is returned as the answer.
```

#### For example:

Input	Result
10 3	5
10 5	0
1 1	1

```
PROGRAM:
import sys
import math
def find_factors(n):
      factors = []
      for i in range(1, int(math.sqrt(n)) + 1):
      if n % i == 0:
      factors.append(i)
      if i != n // i:
             factors.append(n // i)
      return sorted(factors)
def get_pth_factor(n, p):
      factors = find\_factors(n)
      if p <= len(factors):
      return factors[p - 1]
```

else:

return 0

# Reading input directly from the standard input (typically for competitive programming)

input = sys.stdin.read

data = input().split()

n = int(data[0])

p = int(data[1])

# Calculate and print the p-th factor

print(get\_pth\_factor(n, p))

	Input	Expected	Got

## Return Second World in Uppercase

Write a program that takes as input a string (sentence), and returns its second word in uppercase.

#### For example:

If input is "Wipro Technologies Bangalore" the function should return "TECHNOLOGIES"

If input is "Hello World" the function should return "WORLD"

If input is "Hello" the program should return "LESS"

NOTE 1: If input is a sentence with less than 2 words, the program should return the word "LESS".

NOTE 2: The result should have no leading or trailing spaces.

## For example:

Input Result
Wipro Technologies Bangalore
TECHNOLOGIES
Hello World
WORLD
Hello
LESS

```
PROGRAM:
f=input()
s=f.split()
if len(s)>1:
    c=s[1]
    print(c.upper())
else:
    print("LESS")

# **Abundant Number**

An abundant number is a number for which the sum of its proper divisors is greater than the number itself. Proper divisors of the number are those that are strictly lesser than the number.

### **Input Format:**

Take input an integer from stdin

### **Output Format:**

Return Yes if given number is Abundant. Otherwise, print No

# Example input:

12

# **Output**:

Yes

Explanation

The proper divisors of 12 are: 1, 2, 3, 4, 6, whose sum is 1 + 2 + 3 + 4 + 6 = 16. Since sum of proper divisors is greater than the given number, 12 is an abundant number.

# Example input:

13

### **Output**:

No

#### Explanation

The proper divisors of 13 is: 1, whose sum is 1. Since sum of proper divisors is not greater than the given number, 13 is not an abundant number.

#### For example:

Test Result print(abundant(12)) Yes print(abundant(13)) No

```
PROGRAM:

def abundant(n):

l,s=[],0

for i in range(1,int(n//2)+1):

if(n%i==0):

l.append(i)

for i in l:

s+=i

if(s>n):

return("Yes")

else:

# Ugly number

A number is considered to be ugly if its only prime factors are 2, 3 or 5.

[1, 2, 3, 4, 5, 6, 8, 9, 10, 12, 15, ...] is the sequence of ugly numbers.

Task:

complete the function which takes a number n as input and checks if it's an ugly number. return ugly if it is ugly, else return not ugly

Hint:

An ugly number U can be expressed as:  $U = 2^a * 3^b * 5^c$ , where a, b and c are nonnegative integers.

### For example:

Test	Result
print(checkUgly(6))	ugly
print(checkUgly(21))	not ugly

```
def checkUgly(n):
    for i in range(n):
    for j in range(n):
    for k in range(n):
        if(n==(2**i)+(3**j)+(5**k)):
        return("ugly")
    return("not ugly")
```

# **Binary String**

Coders here is a simple task for you, Given string str. Your task is to check whether it is a binary string or not by using python set.

Examples:

Input: str = "01010101010"

Output: Yes

Input: str = "REC101"

Output: No

### For example:

Input	Result
01010101010	Yes
010101 10101	No

```
a = input()
try:
    c = int(a)
    print("Yes")
except:
    print("No")
```

Ex. No. : 8.2 Date:

# **Check Pair**

Given a tuple and a positive integer k, the task is to find the count of distinct pairs in the tuple whose sum is equal to K.

# **Examples:**

**Input**: t = (5, 6, 5, 7, 7, 8), K = 13

Output: 2 Explanation:

Pairs with sum K(=13) are  $\{(5, 8), (6, 7), (6, 7)\}$ .

Therefore, distinct pairs with sum K(=13) are  $\{(5, 8), (6, 7)\}$ .

Therefore, the required output is 2.

### For example:

Input	Result
1,2,1,2,5	1
1,2	0
0	

```
for i in range(len(l)):

for j in range(i + 1, len(l)):

if l[i] + l[j] == k:

s = (l[i], l[j])

if s not in x and (l[j], l[i]) not in x:

count += 1

x.add(s)
```

print(count)

	Input	Expected	Got	
<b>~</b>	5,6,5,7,7,8 13	2	2	*

# **DNA Sequence**

The **DNA** sequence is composed of a series of nucleotides abbreviated as 'A', 'C', 'G', and 'T'.

For example, "ACGAATTCCG" is a **DNA sequence**.

When studying **DNA**, it is useful to identify repeated sequences within the DNA.

Given a string s that represents a **DNA sequence**, return all the 10-letter-long sequences (substrings) that occur more than once in a DNA molecule. You may return the answer in **any order**.

## Example 1:

Input: s = "AAAAACCCCCAAAAACCCCCCAAAAAGGGTTT"

Output: ["AAAAACCCCC","CCCCCAAAAA"]

Example 2:

Input: s = "AAAAAAAAAAA"
Output: ["AAAAAAAAA"]

## For example:

Input	Result
AAAAACCCCCAAAAACCCCCCAAAAAGGGTTT	AAAAACCCCC CCCCAAAAA

```
s = input()
j = []
repeated = set()
for i in range(len(s) - 9):
    sequence = s[i:i+10]
    if sequence in j:
        repeated.add(sequence)
    else:
        j.append(sequence)
l=list(repeated)
l=list(reversed(l))
for i in l:
    print(i)
```

	Input	Expected	Got

## Uncommon words

A sentence is a string of single-space separated words where each word consists only of lowercase letters. A word is uncommon if it appears exactly once in one of the sentences, and does not appear in the other sentence.

Given two sentences s1 and s2, return a list of all the uncommon words. You may return the answer in any order.

Example 1:

Input: s1 = "this apple is sweet", s2 = "this apple is sour"

Output: ["sweet", "sour"]

Example 2:

Input: s1 = "apple apple", s2 = "banana"

Output: ["banana"]

Constraints:

1 <= s1.length, s2.length <= 200

s1 and s2 consist of lowercase English letters and spaces.

s1 and s2 do not have leading or trailing spaces.

All the words in s1 and s2 are separated by a single space.

Note:

Use dictionary to solve the problem

Input	Result
this apple is sweet this apple is sour	sweet sour

```
a=input().split()
b=input().split()
c1,c2,l={},{},{},[]
for i in a:
    c1[i]=c1.get(i,0)+1
for j in b:
    c2[j]=c2.get(j,0)+1
for w,c in c1.items():
    if(c==1 and w not in b):
        l.append(w)
    for w,c in c2.items():
        if(c==1 and w not in a):
            l.append(w)
        print(*l)

# Scramble Score

In the game of Scrabble<sup>TM</sup>, each letter has points associated with it. The total score of a word is the sum of the scores of its letters. More common letters are worth fewer points while less common letters are worth more points.

Write a program that computes and displays the Scrabble<sup>TM</sup> score for a word. Create a dictionary that maps from letters to point values. Then use the dictionary to compute the score.

A Scrabble<sup>TM</sup> board includes some squares that multiply the value of a letter or the value of an entire word. We will ignore these squares in this exercise.

The points associated with each letter are shown below:

Points Letters

1 A, E, I, L, N, O, R, S, T and U

2 D and G

3 B, C, M and P

4 F, H, V, W and Y

5 K

8 J and X

10 Q and Z

Sample Input

REC

Sample Output

REC is worth 5 points.

```
letter_scores = {
    'A': 1, 'E': 1, 'I': 1, 'L': 1, 'N': 1, 'O': 1, 'R': 1, 'S': 1, 'T': 1, 'U': 1,
    'D': 2, 'G': 2,
    'B': 3, 'C': 3, 'M': 3, 'P': 3,
```

```
'F': 4, 'H': 4, 'V': 4, 'W': 4, 'Y': 4,

'K': 5,

'J': 8, 'X': 8,

'Q': 10, 'Z': 10

}
word = input().upper()
score = sum(letter_scores.get(letter, 0) for letter in word)
print(word,"is worth",score,"points.")

## **Bubble Sort**

Given an list of integers, sort the array in ascending order using the Bubble *Sort* algorithm above. Once sorted, print the following three lines:

- <u>List</u> is sorted in numSwaps swaps., where numSwaps is the number of swaps that took place.
- 2. First Element: firstElement, the *first* element in the sorted list.
- Last Element: lastElement, the *last* element in the sorted list.

For example, given a worst-case but small array to sort: a=[6,4,1]. It took 3 swaps to sort the array. Output would be

Array is sorted in 3 swaps.

First Element: 1 Last Element: 6

#### **Input Format**

The first line contains the size of the list a. an integer,n, The second line contains n, space-separated integers a[i].

#### **Constraints**

- 2<=n<=600
- $1 \le a[i] \le 2x10^6$ .

#### **Output Format**

You must print the following three lines of output:

- List is sorted in numSwaps swaps., where numSwaps is the number of swaps that took place.
- 2. First Element: firstElement, the *first* element in the sorted list.
- 3. Last Element: lastElement, the *last* element in the sorted list.

#### Sample Input 0

3

123

#### Sample Output 0

List is sorted in 0 swaps.

First Element: 1 Last Element: 3

## For example:

Input	Result
3 3 2 1	List is sorted in 3 swaps. First Element: 1 Last Element: 3
5 19284	List is sorted in 4 swaps. First Element: 1 Last Element: 9

#### **PROGRAM:**

```
def bubble_sort(arr):
  n = len(arr)
  swaps = 0
  for i in range(n):
     for j in range(0, n-i-1):
       if arr[j] > arr[j + 1]:
          # Swap elements
          arr[j], arr[j + 1] = arr[j + 1], arr[j]
          swaps += 1
  return swaps
# Input the size of the list
n = int(input())
# Input the list of integers
arr = list(map(int, input().split()))
# Perform bubble sort and count the number of swaps
num_swaps = bubble_sort(arr)
```

# Print the number of swaps
print("List is sorted in", num\_swaps, "swaps.")

# Print the first element
print("First Element:", arr[0])

# Print the last element
print("Last Element:", arr[-1])

1<=n, arr[i]<=100

## Input:

 $1\;68\;79\;4\;90\;68\;1\;4\;5$ 

#### output:

12

42

5 1

 $68\ 2$ 

79 1

90 1

## For example:

Input	Result
4 3 5 3 4 5	3 2 4 2 5 2

### PROGRAM:

 $def \ count\_frequency (arr):$ 

 $frequency = {}$ 

# Count the frequency of each number in the list

for num in arr:

frequency[num] = frequency.get(num, 0) + 1

# Sort the dictionary based on keys
sorted\_frequency = sorted(frequency.items())

# Print the frequency of each number
for num, freq in sorted\_frequency:
 print(num, freq)

# Input the list of numbers
arr = list(map(int, input().split()))

# Count the frequency and print the result
count\_frequency(arr)
